

Brian Smith

There are many ways that we can all help preserve energy. We can preserve our electricity by changing our habits and making small changes in our daily life. Another way to preserve energy would be to use solar power energy instead of electricity. My idea to save even more energy would be to invent a hydro powered vehicle. This invention would help save our oil and gasoline supplies. Using these ways to make power would help us use less electricity and preserve energy.

Electricity is one of the biggest energy sources that we can save. Instead of using electricity we could use rechargeable batteries. Instead of turning the heat up really high you can get an extra blanket to keep you warm. When no one is at home you can make sure to turn off all of the lights and unplug things that are not being used. Everyone has the ability to save energy by doing these things.

Another way to conserve energy is to use solar power. Solar power is created when you use the sun to power things. You can put solar panels on your roof to use to create heat for your heating system and water. This energy could also power your house instead of using electricity. We could use more solar powered cars that would help us conserve energy by using less gasoline. These are good ways to save energy using solar power.

One other way that I think would help save energy would be to invent a hydro powered car. My idea to invent a hydro powered car would help preserve our oil and gasoline resources. My car will run on just water and make less pollution in the air. Because the water has to be moving very fast I would create a very powerful fan to make the water move very fast to make a whirlpool. This will create the energy and power for the car to move.

We can all make a difference conserving our energy. We can all conserve electricity by doing many small things that will make a big difference. We could use more solar power as another source of energy. My invention of a hydro powered car would help save a lot of our fossil fuels. These are some of the ways that we can conserve our energy sources.
